# What do repeated measures actually do to the data?

◆□▶ ◆□▶ ◆ 臣▶ ◆ 臣▶ ○ 臣 ○ の Q @

inter- and intra- variance

- inter- and intra- variance
- random jitter from our choice of sample population

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三三 - のへぐ

- inter- and intra- variance
- random jitter from our choice of sample population
- each subject fulfills a certain "condition", but random error pro instance of the condition

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

- inter- and intra- variance
- random jitter from our choice of sample population
- each subject fulfills a certain "condition", but random error pro instance of the condition

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三 のへぐ

similar idea for item analysis in linguistic designs

only when we want to make intrasample predictions

(ロ)、(型)、(E)、(E)、 E) の(()

only when we want to make intrasample predictions

▲□▶ ▲□▶ ▲ □▶ ▲ □▶ □ のへぐ

i.e. sample==population

only when we want to make intrasample predictions

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三 のへぐ

- i.e. sample==population
- fixed means known variance / manipulation

- only when we want to make intrasample predictions
- ▶ i.e. sample==population
- fixed means known variance / manipulation
- fixed-effects: directed, preferably "exhaustive" manipulation

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三 のへぐ

"random" means unknown variance

"random" means unknown variance

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三三 - のへぐ

error term is a random effect

- "random" means unknown variance
- error term is a random effect
- correction for the error resulting from our particular choice of sample

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三 のへぐ

- "random" means unknown variance
- error term is a random effect
- correction for the error resulting from our particular choice of sample

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

correction per grouping for slope and intercept possible

- "random" means unknown variance
- error term is a random effect
- correction for the error resulting from our particular choice of sample

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

- correction per grouping for slope and intercept possible
- error term per grouping!

"Mixed" because both fixed random effects are used

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三三 - のへぐ

> ?formula

- "Mixed" because both fixed random effects are used
- Same basic formula syntax dep ~ indep | group

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

> ?formula

- "Mixed" because both fixed random effects are used
- Same basic formula syntax dep ~ indep | group
- additional (indep|group) terms for random effects

combine by-subject and by-item analyses in one step

(ロ)、(型)、(E)、(E)、 E) の(()

combine by-subject and by-item analyses in one step
cf. Clark (1973)

 Early idea: build up from minimal structure until improvements don't bring you anything on ANOVA (R. Baayen, Davidson, and Bates 2008)

- Early idea: build up from minimal structure until improvements don't bring you anything on ANOVA (R. Baayen, Davidson, and Bates 2008)
- New idea: Use the most complicated random effects structure possible (Barr et al. 2013)

Possible random effect structures for ONE fixed factor:

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ □臣 ○のへ⊙

- 1. Intercepts only by random factor:
  - (1 | random.factor)

Possible random effect structures for ONE fixed factor:

- $1. \$  Intercepts only by random factor:
  - (1 | random.factor)
- 2. Slopes only by random factor:

(0 + fixed.factor | random.factor)

Possible random effect structures for ONE fixed factor:

- 1. Intercepts only by random factor:
  - (1 | random.factor)
- 2. Slopes only by random factor:
  - (0 + fixed.factor | random.factor)
- 3. Intercepts and slopes by random factor:
  - (1 + fixed.factor | random.factor)

Possible random effect structures for ONE fixed factor:

- 1. Intercepts only by random factor:
  - (1 | random.factor)
- 2. Slopes only by random factor:

(0 + fixed.factor | random.factor)

3. Intercepts and slopes by random factor:

(1 + fixed.factor | random.factor)

4. Intercept and slope, separately, by random factor: (1 | random.factor) + (0 + fixed.factor | random.factor)

#### focus on estimation, not significance

◆□▶ ◆□▶ ◆ 臣▶ ◆ 臣▶ ○ 臣 ○ の Q @

- focus on estimation, not significance
- the purely fixed-effects model was able to demonstrate significance of the main effect

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三三 - のへぐ

#### Don't get us started

- focus on estimation, not significance
- the purely fixed-effects model was able to demonstrate significance of the main effect
- but provided a poor overall description (fit) of the data lousy estimate

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

## Don't get us started

- focus on estimation, not significance
- the purely fixed-effects model was able to demonstrate significance of the main effect
- but provided a poor overall description (fit) of the data lousy estimate

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

this is the foundation of the new statistics (cf. Cummings 2014)

### Don't get us started

- focus on estimation, not significance
- the purely fixed-effects model was able to demonstrate significance of the main effect
- but provided a poor overall description (fit) of the data lousy estimate

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

- this is the foundation of the new statistics (cf. Cummings 2014)
- after all, "the goal is precision"

When things go wrong

(ロ)、(型)、(E)、(E)、(E)、(O)()

## Possible warning messages

 Convergence warnings: you don't have enough data for the proposed model structure

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三三 - のへぐ

## Possible warning messages

- Convergence warnings: you don't have enough data for the proposed model structure
- Singular: perfect multicollinearity (at least one variable is linear combination of the others)

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

## Possible warning messages

- Convergence warnings: you don't have enough data for the proposed model structure
- Singular: perfect multicollinearity (at least one variable is linear combination of the others)
- Not positive definite: matrix not greater than "zero"; too much correlation / collinearity, not enough data
